The invention is useful for identifying a modulator of GPCR of treating a disease or condition mediated by a human protease. The invention is also useful as models for the development of human therapeutics, for identifying therapeutic proteins, as targets for development of human therapeutic agents, and as query sequence to perform a search against sequence databases to, for e.g., identify other family members of related sequences. The vector of the invention is useful for producing a GPCR protein or peptide, for conducting cell-based assays involving the GPCR protein or its fragment, for identifying GPCR protein mutants whose functions are affected, and to produce non-human transgenic animals. The present amino acid sequence represents the human G-protein coupled receptor (GPCR) protein of the invention. This sequence is encoded by the human G-protein coupled receptor the human G-protein coupled receptor the human G-protein coupled the human G-protein coupled receptor (GPCR) gene located on

The G protein-coupled receptor can be used for preventing, treating and diagnosing genetic diseases associated with G protein-coupled protein, and for regulating cellular functions. The protein can be used to prevent and treat disorders associated with G protein-coupled protein gene dysfunction. It can also be used to identify G protein-coupled protein ligands and generating antibodies and antisear against the protein. It is also useful in constructing recombinant receptor protein expression systems, developing receptor-binding assay systems and screening drug candidates, and can be used as probe in the genetic diagnosis of G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

These can be used in the identification of candidate compounds as receptor agonists or inverse agonists having applicability as therapeutic agents. The present sequencis a GPCR protein of the invention
                                                                                                                                                                                                                                                                                                 Novel endogenous and non-endogenous versions of G protein-coupled receptor useful for identification of candidate compounds as receptors or antagonists for use as therapeutic agents.
                                                                                                                                                                               Sequence 322
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; G-protein coupled receptor; GPCR; hRUP28; hRUP29; hRUP30; hRUP31; hRUP32; hRUP33; hRUP34; hRUP35; hRUP36; hRUP37.

                                                                                                                                                                                                                                                     The invention relates to Mrg (mas-related gene) protein, which is a G-protein coupled receptor and drg-12 protein, which is a receptor. The invention is useful for identifying compounds that bind to it, especially agonists or antagonists. Administration of an agent (e.g. the identified agonist) that increases the expression of Mrg in a mammal may be used for treating impaired sensory perception in a mammal, especially pain. The antagonist may also be useful for treating impaired sensory perception in a mammal. The present sequence is human MrgX3 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated polypeptide, Mrg, which is a G-protein coupled receptor a isolated polypeptide, drg-12, which is also a receptor, useful for identifying agonists or antagonists for treating pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       04-MAY-2000; 2000US-022027P.

New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing õ

Disclosure; SEQ ID NO 529; 1498pp; English

This invention relates to a novel nucleic acids, and encoded polypeptides thereof, which have properties related to the stimulation of biochemical corphysiological responses in a cell, tissue, organ or organism.

CC Specifically, it refers to the use of biologically active fragments for diverse pathological conditions. The purthermore in the treatment of diverse pathological conditions. The purthermore in the treatment of conditions as well as methods to modulate their conditions as well as methods to modulate their conditions are useful in the diverse pathological conditions. The purthermore in the treatment of conditions are useful in the love polypeptides, polynucleotides and antibodies are useful in the treating or preventing Novy-associated disorders, e.g. cardiomyopathy, contracted their conditions, allergies, blood disorders, acquired immunodeficiency syndrome (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, cartiritis, Alzheimer's disease, infections, stroke, muscular dystrophy can epilepsy. Accordingly, these molecules have many activities including cytostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, neuroprotective, nootropic, antiartrhritic, hepatotropic, antiartrhritic, hepatotropic, antiartrhritic, hepatotropic, antiartrhritic, hepatotropic, antiarteriosclerotic, ancreding consultation, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, used as in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. This polypeptide is a homologue of a human NOVX protein coffice of the invention. pharmacogenomics. of the invention.

New NOVX polypeptides and nucleic acids, useful for preventing c treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue pharmacogenomics. or typing ဝူ

Disclosure; SEQ ID NO 534; 1498pp; English

This invention relates to a novel nucleic acids, and encoded polypeptides CC thereof, which have properties related to the stimulation of biochemical CC or physiological responses in a cell, tissue, organ or organism. CC Specifically, it refers to the use of biologically active fragments for CC diagnostic and prognostic assays and furthermore in the treatment of CC diverse pathological conditions. The present invention describes novel thuman and murine NOVX proteins, as well as methods to modulate their CC expression using antisense oligos, ribozymes and peptide nucleic acids. The NOVX polypeptides, polynucleotides and antibodies are useful in CC treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, CC atherosclarosis, cancer and diabetes. Furthermore, they may be used in CC treating or preventing diseases such as inflammation, autoimmune CC disorders, allergies, blood disorders, acquired immunodeficiency syndrome CC disorders, allergies, blood disorders, acquired immunodeficiency syndrome CC antistitis, Alzheimer's disease, infections, stroke, muscular dystrophy CC and epilepsy. Accordingly, these molecules have many activities including CC treatic, cardiant, antiinflammatory, immunosuppressive, antiallergic, hammostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, cantiasthmatic, nephrotropic, antibacterial, virucide, antiparasitic, CC neuroprotective, nootropic, antibacterial, virucide, antiparasitic, relaxant and anticonvulsant. In addition, they are useful in screening casays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also

Disclosure; Fig 1; 523pp; English.

The present invention describes antigenic peptides (I) comprising: (a) CC any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino CC acids. Also described: (1) an assay for the detection of a particular GC protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; CC and (2) an isolated antibody having high specificity and high affinity or CC avidity for a particular GPCR. (I) can be used as GPCR modulators and in CC gene therapy. The antigenic peptides for GPCRs are useful in detecting an CC antibody against a particular GPCR, and in the production of specific CC antibody against a particular GPCR, and in the production of specific CC antibodies. The peptides and antibodies are also useful for detecting the CC presence or absence of corresponding GPCRs. The antigenic peptides for CC GPCRs and antibodies are useful for diagnosing and designing drugs for CC treating immune-related diseases, immunological-related cell proliferative CC diseases, or autoimmune diseases, e.g. AlDS, Alzheimer's disease, CC atherosclerosis, bacterial, fungal, protozoan or viral infections, osteoparthitis, osteoporosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, diabetes, graft versus host disease, Parkinson's disease, multiple sclerosis, pain, psoriasis, anxiety, depression, schizophrenia, dementia, mental retardation, memory loss, epilepsy, asthma, tuberculcosis, obesity, nausea, hypertension, hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be used in immunoassays and immunoassays and immunoassays and emmonoaconsis. ABZ42523 to ABZ42869 encode GPCR proteins given in ABP81675 to ABP82018, which are used in the exemplification the present invention

The MrgD polypeptides are useful as therapeutics or for identifying compounds, i.e. agonists or antagonists, that alter pain perception in a mammal. The compounds are useful for treating impaired sensory perception, e.g. chronic intractable pain or neuropathic pain, promoting wound healing, restoring normal sensitivity following injury, or treating ocular conditions, particularly those associated with pressure such as glaucoma. The Mrg genes or proteins may be used as molecular probes for the detection of cells or tissues related to or involved with sensory perception. The present sequence represents a MrgA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New mas-related gene D polypeptides, useful as therapeutics or in identifying agonists or antagonists that alter pain perception in a mammal for treating impaired sensory perception, e.g. chronic intractable pain or neuropathic pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       13-MAY-2003; 2003WO-US015004

                                                                                                                                                                                                                                                                                                                  The invention relates to a non-human mammal that carries a DNA integrated with a foreign HI77213 or its mutant gene, or a part of it. The non-human animal is particularly a rat. Such gene shows phenotypes of e.g. cataract conset, transient skin rash and proliferation-promoting activity. The foreign HI77213 gene is a gene that encodes a G protein-coupled receptor (GPCR) protein HI77213. The protein, its encoded DNA and constructed transgenic animals are useful for clarifying pathological mechanism, developing therapeutic methods and screening preventives or remedies for related diseases e.g. cataract, cancer, and dermatitis. The present sequence represents a human HI77213 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HI7T213 protein, encoded DNA and transgenic animals for clarifying pathological mechanism, developing therapeutic methods and screening preventives or remedies for related diseases e.g. cataract, cancer, a

  mouse comprising a GPCR gene of the invention; a mouse comprising a mutation in a GPCR transgene or in an endogenous GPCR gene; cells derived from the trasngenic mice; kits comprising several mice, each of which has a mutation in a different GPCR gene of the invention; and kits comprising probes which hybridise to GPCR polynucleotides of the invention. The invention further discloses variants of the GPCR polypeptides and vectors comprising a GPCR nucleic acid. The GPCR nucleic acids and proteins may be used in the diagnosis, treatment or prevention of a wide variety of diseases including neurological disorders (e.g., Alzheimer's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       colon disorder; intestinal disorder; cardiovascular disorder; muscular disorder; blood disorder; immune disorder; bone disorder; joint disorder; metabolic disorder; mutritive disorder; bone disorder; kidney disorder; liver disorder; lung disorder; breast disorder; kidney disorder; ruterus disorder; lung disorder; testis disorder; ovary disorder; ruterus disorder; prostate disorder; stemach disorder; prostate disorder; pelen disorder; skin disorder; thyroid disorder; antiparkinsonian; antimanic; thymus disorder; thyroid disorder; antiparkinsonian; antimanic; cytostatic; antiinflammatory; vasotropic; antianginal; antiarrhythmic; cortostatic; antiinflammatory; vasotropic; antianginal; antiseborrhoeic; virucide; hepatotropic; antibacterial; antianaemic; antiseborrhoeic; dermatological; antibleer; antibacterial; antianaemic; antiseborrhoeic; dermatological; antibleer; antibacterial; antianaemic; antopic; humanical; antiseborrhoeic;
                                                                                                                                                                                               The invention relates to human and mouse G protein-coupled receptors (GPCRs) and nucleic acids encoding them. The invention also relates to sequences at least 90% identical to the GPCR proteins and nucleic acids of the invention; methods of treating, preventing or diagnosing diseases associated with GPCRs of the invention; methods of screening for compounds useful in the treatment of GPCR-related diseases; a transgenic
                                                                                                                                                                                                                                                                                                                                                                                                      Novel mammalian G protein coupled receptors, useful for identifying compounds that modulates diagnosing and treating disease condition associated with GPCR dysfunction e.g. autoimmune diseases, angina pectoris, Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         G protein-coupled receptor; GPCR; drug screening; diagnosis; transgenic mouse; neurological disorder; adrenal gland disorder;

A suitable fluorescent protein for incorporation in the fusion protein is green fluorescent protein (GFP), for example GFP-1, wild-type GFP, GFPuv or Enhanced GFP (BGPP). The method is useful for the identification of ligands binding to an orphan receptor protein.
                                                                                                                                                                     Human; G protein-coupled receptor; hippocampus; diagnosis; screening; genetic disease; cellular function regulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel method of identifying ligands to orphan receptor protein which comprises transforming cells with DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Transformation of cells with a fusion protein protein with a fluorescent protein useful for
                                                                                                                                                                                                                                                   Human G protein-coupled receptor hHI7T213V SEQ ID NO:2
                                                                                                                                                                                                                                                                                                             18-AUG-2000

The protein can be used to preve and treat disorders associated with G protein-coupled protein gene dysfunction. It can also be used to identify G protein-coupled protein ligands and generating antibodies and antisera against the protein. It also useful in constructing recombinant receptor protein expression systems, developing receptor-binding assay systems and screening drug candidates, and can be used as a probe in the genetic diagnosis of G protein-coupled protein disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human-derived G protein-coupled protein and encoding nucleic acid, useful e.g. in determining ligands and treatment of diseases associated with dysfunction of the protein.

This invention relates to a novel nucleic acids, and encoded polypeptides core thereof, which have properties related to the stimulation of biochemical core physiological responses in a cell, tissue, organ or organism.

CC Specifically, it refers to the use of biologically active fragments for conditions. The present invention describes novel the use and furthermore in the treatment of conditions. The present invention describes novel than and murine NOVX protesias, as well as methods to modulate their compression using antisense oligos, ribozymes and peptide nucleic acids. CC The NOVX polypeptides, polynucleotides and antibodies are useful in comparison or preventing NOVX-associated disorders, e.g. cardiomyopathy, cratering or preventing NOVX-associated disorders, e.g. cardiomyopathy, ctreating or preventing diseases such as inflammation, autoimmune comparison of the preventing diseases such as inflammation, autoimmune comparison, obesity, asthmatic, immunoglobulin (Ig)A nephropathy, cirrhosis, cardiant, antiinflammatory, immunosuppressive, antialization, cytostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, cantisative, nortopic, antibaterial, virucide, antiparasitic, cardiant, antinflammatory, immunosuppressive, antialization, cellulated assays to identify small molecules that modulate or inhibit, for example, cardiant and anticonvolsant. In addition, they are useful in screening considers as in chromosome mapping, tissue typing, preventive medicine and plantancegenomics. This polypeptide is a homologue of a human NOVX protein
                                       pharmacogenomics.
of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New NOVX polypeptides and nucleic acids, useful treating NOVX-associated disorders, e.g. cancer atherosclerosis, or diabetes, and in chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Grosse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQ

New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing atherosclerosis, pharmacogenomics. õ

Disclosure; SEQ ID NO 535; 1498pp; English

CC or physiological responses in a cell, tissue, organ or organism.
CC specifically, it refers to the use of biologically active fragments for CC diverse pathological conditions. The present invention describes novel CC diverse pathological conditions. The present invention describes novel CC human and murine NOVX proteins, as well as methods to modulate their CC expression using antisense oligos, ribozymes and peptide nucleic acids. CC The NOVX polypeptides, polymucleotides and antibodies are useful in CC treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, CC atherosclerosis, cancer and diabetes. Furthermore, they may be used in CC treating or preventing diseases such as inflammation, autoimmune CC disorders, allergies, blood disorders, acquired immunodeficiency syndrome CC (AIDS), obesity, asthma, immunoglobulin (1g)A mephropathy, cirrhosis, CC arthritis, Alzheimer's disease, infections, stroke, muscular dystrophy CC ard epilepsy. Accordingly, these molecules have many activities including Cryostatic, cardiant, antiinflammatory, immunosuppressive, antiallergic, cardiabetic, antiarteriosclerotic, anorectic, CC antiasthmatic, nephrotropic, antibacterial, virucide, antiparasitic, curvalent and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, CC used as in chromosome mapping, tissue typing, preventive medicine and CC of the invention. This polypeptide is a homologue of a human NOVX protein of the invention. This invention relates to a novel nucleic acids, and encoded thereof, which have properties related to the stimulation of polypeptides biochemical

                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel polynucleotide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The protein sequences shown in ADC85549-ADC87617 represent GPCR's of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polynucleotide, useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor.
                                                                                                                                                                                                                                                                                                                                                                                              Sequence 322 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 2; SEQ ID NO 1274; 28pp; English.

Sequence 7, Application US/09254227A

Patent No. 6696257

GENERAL INFORMATION:

APPLICANT: Abmad, Sultan

APPLICANT: Banville, Denis

APPLICANT: Lembo, Pacla

APPLICANT: Lembo, Pacla

APPLICANT: Lembo, Pacla

APPLICANT: Shi-Hsiang, Shen

TITLE OF INVENTION: G Protein-Coupled Receptors fro

FILS REFERENCE: 81823/268117

CURRENT APPLICATION NUMBER: US/09/254,227A

CURRENT FILING DATE: 199-03-03

NUMBER OF SEQ ID NOS: 22

SOFTWARE: Patentin version 3.0

SEQ ID NO 7
